# Research Questions

## Main Research Question

***How can we refine the CG iteration bound for Schwarz-preconditioned high-contrast heterogeneous elliptic problems beyond the classical condition number-based bound?***

# Research Questions

## Subsidiary Research Questions

- Q1** What other spectral characteristics like the condition number can we consider?
- Q2** How to estimate the characteristics from **Q1**?
- Q3** Given a toy eigenspectrum, how can we sharpen the CG iteration bound?
- Q4** How does the sharpened bound from **Q3** compare to the classical CG bound?
- Q5** How does the performance described in **Q4** depend on the characteristics found in **Q1**?
- Q6** Can the sharpened bound from **Q3** distinguish between preconditioners?

# Background & Literature

Conjugate gradient method: residual polynomial

- Iterative, projection method onto a Krylov subspace  $\mathcal{K}_m(A_0, \mathbf{r}_0)$  given by

$$\text{span}\{\mathbf{r}_0, A\mathbf{r}_0, A^2\mathbf{r}_0, \dots, A^{m-1}\mathbf{r}_0\}$$

# Background & Literature

## Conjugate gradient method: residual polynomial

- Iterative, projection method onto a Krylov subspace  $\mathcal{K}_m(A_0, \mathbf{r}_0)$  given by

$$\text{span}\{\mathbf{r}_0, A\mathbf{r}_0, A^2\mathbf{r}_0, \dots, A^{m-1}\mathbf{r}_0\}$$

- Approximate solution can be expressed as

$$\mathbf{u}_m = \mathbf{u}_0 + \sum_{i=0}^{m-1} c_i A^i \mathbf{r}_0 = \mathbf{u}_0 + q_{m-1}(A) \mathbf{r}_0$$

# Background & Literature

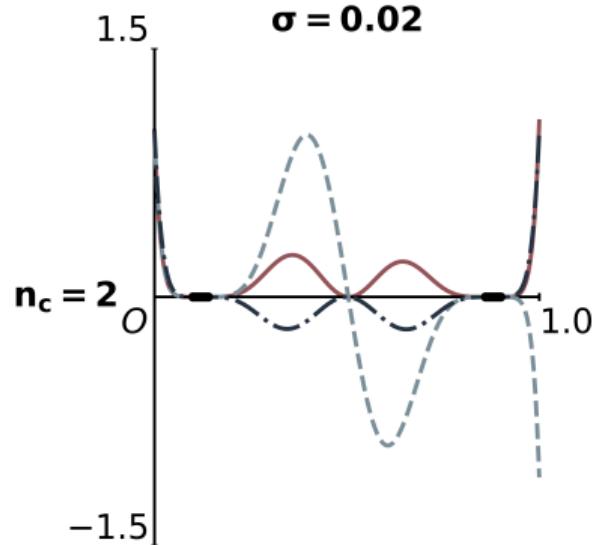

## Conjugate gradient method: residual polynomial

- Iterative, projection method onto a Krylov subspace  $\mathcal{K}_m(A_0, \mathbf{r}_0)$  given by

$$\text{span}\{\mathbf{r}_0, A\mathbf{r}_0, A^2\mathbf{r}_0, \dots, A^{m-1}\mathbf{r}_0\}$$

- Approximate solution can be expressed as

$$\mathbf{u}_m = \mathbf{u}_0 + \sum_{i=0}^{m-1} c_i A^i \mathbf{r}_0 = \mathbf{u}_0 + q_{m-1}(A) \mathbf{r}_0$$

**Figure:** Residual polynomial  $r_m(\lambda) = 1 - \lambda q_{m-1}(\lambda)$

# Background & Literature

## Conjugate gradient method: residual polynomial

- Iterative, projection method onto a Krylov subspace  $\mathcal{K}_m(A_0, \mathbf{r}_0)$  given by

$$\text{span}\{\mathbf{r}_0, A\mathbf{r}_0, A^2\mathbf{r}_0, \dots, A^{m-1}\mathbf{r}_0\}$$

- Approximate solution can be expressed as

$$\mathbf{u}_m = \mathbf{u}_0 + \sum_{i=0}^{m-1} c_i A^i \mathbf{r}_0 = \mathbf{u}_0 + q_{m-1}(A) \mathbf{r}_0$$

- Minimize residual polynomial on eigenvalues of  $A$

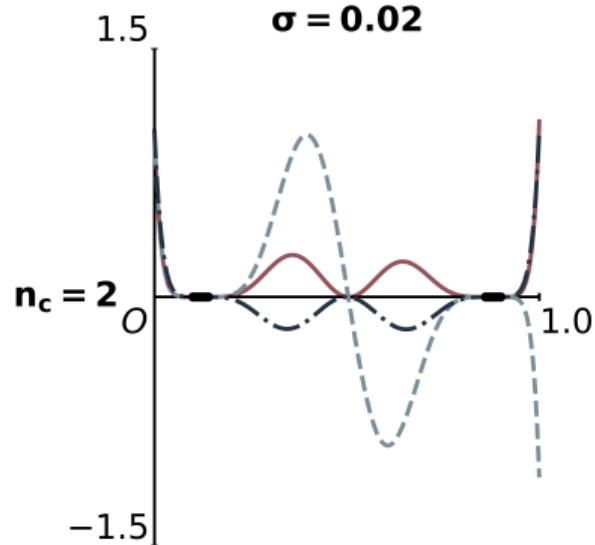

Figure: Residual polynomial  $r_m(\lambda) = 1 - \lambda q_{m-1}(\lambda)$

# Background & Literature

## Conjugate gradient method: convergence

- Classical (condition number) convergence bound:

### Theorem

*The error of the  $m^{\text{th}}$  iterate of the CG algorithm is bounded by*

$$\|\mathbf{e}_m\| \leq 2 \left( \frac{\sqrt{\kappa} - 1}{\sqrt{\kappa} + 1} \right)^m \|\mathbf{e}_0\|_A,$$

*where  $\kappa = \lambda_{\max}/\lambda_{\min}$  is the condition number of (symmetric matrix)  $A$ .*

# Background & Literature

## Conjugate gradient method: convergence

- Classical (condition number) convergence bound:

### Theorem

The error of the  $m^{\text{th}}$  iterate of the CG algorithm is bounded by

$$\|\mathbf{e}_m\| \leq 2 \left( \frac{\sqrt{\kappa} - 1}{\sqrt{\kappa} + 1} \right)^m \|\mathbf{e}_0\|_A,$$

where  $\kappa = \lambda_{\max}/\lambda_{\min}$  is the condition number of (symmetric matrix)  $A$ .

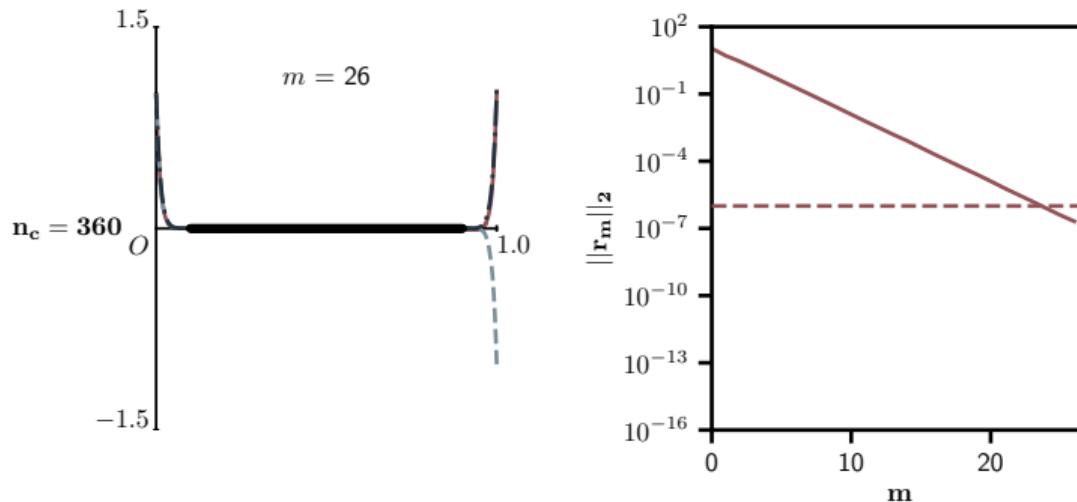

- Only sharp for **uniform** eigenvalue distributions!

$$\|\mathbf{e}_m\|_A \leq \min_{r \in \mathcal{P}_{m-1}, r(0)=1} \max_{\lambda \in [\lambda_{\min}, \lambda_{\max}]} |r(\lambda)| \|\mathbf{e}_0\|_A \stackrel{\text{uniform } \sigma(A)}{=} \frac{\|\mathbf{e}_0\|}{C_m \left( \frac{\kappa+1}{\kappa-1} \right)}$$

# Background & Literature

Conjugate gradient method: spectral distribution

Setting  $\lambda_{\min} = 0.1$  and  $\lambda_{\max} = 0.9$  gives  $m_{\text{classical}} = 26$ . Worst case distribution:

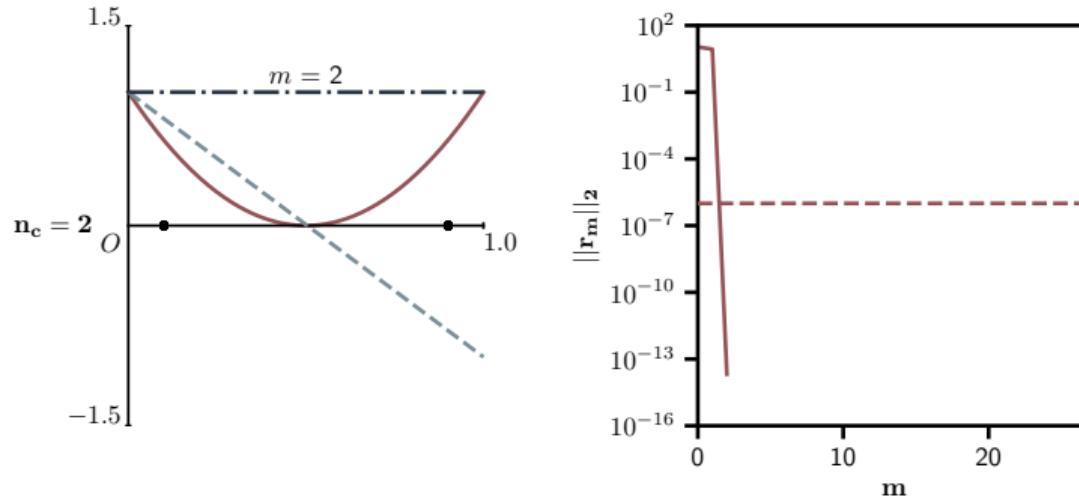

**Figure:** CG convergence for uniform spectrum.

# Background & Literature

Conjugate gradient method: spectral distribution

Setting  $\lambda_{\min} = 0.1$  and  $\lambda_{\max} = 0.9$  gives  $m_{\text{classical}} = 26$ . Best case distribution:

**Figure:** CG convergence for spectrum with two distinct eigenvalues.

# Background & Literature

## Conjugate gradient method: non-uniform spectra

- Clusterpoint distribution ( $0 < \rho \leq 1$ )<sup>2</sup>

$$\lambda_i = \lambda_1 + \frac{i-1}{N-1}(\lambda_N - \lambda_1)\rho_i^{N-i},$$

For  $i = 1, \dots, N$
